

# The Language Patterns Project

## Website Architecture Handoff

Discovery 001

## Project Overview

The Language Patterns Project is **not** a book, blog, or documentation website.

It is a **living research specification** whose purpose is to discover, validate, and document the recurring structures through which meaning is represented and communicated.

The project follows an **Infinite Game** philosophy. It is intended to evolve continuously through observation, experimentation, evidence, and refinement.

The website should be designed as a **research laboratory** that produces a stable **specification**.

---

## Guiding Principle

**Research produces Specification. Specification does not produce Research.**

The website should make this relationship explicit.

---

## Section Descriptions

### Home

Purpose:

Introduce the project.

Contents:

- Mission Statement
- Infinite Game Philosophy
- Current Discovery Number
- Latest Research
- Latest Discoveries
- Quick links into Research and Specification

---

### Vision

Purpose:

Explain why the project exists.

Contents:

- Philosophy
  - Motivation
  - Infinite Research Covenant
  - Long-term goals
- 

## Research

Purpose:

This is the active research laboratory.

Nothing here is considered permanent.

Everything is subject to refinement.

Subsections:

---

## Research Protocol

Defines the scientific method used throughout the project.

Should include:

- Research lifecycle
  - Confidence model
  - Evidence requirements
  - Counterexample requirements
  - Discovery promotion process
- 

## Observations

Personal or empirical observations.

These are not hypotheses.

Example:

O-001

Programming made the concept of context explicit.

Status:

Observation

---

## Questions

Questions that have not yet become hypotheses.

Example:

Q-001

Can entirely new conceptual mappings be created?

---

## Hypotheses

Research hypotheses.

Each hypothesis should include:

- ID
  - Status
  - Motivation
  - Question
  - Hypothesis
  - Predictions
  - Evidence
  - Counter Evidence
  - Confidence
  - Related Research
- 

## Experiments

Documents experiments used to validate hypotheses.

Each experiment should contain:

- Purpose
- Method
- Corpus

- Results
  - Conclusions
  - Related Hypotheses
- 

## Discoveries

Validated findings.

Discoveries may eventually become part of the Specification.

---

## Research Journal

Chronological research log.

Every research session produces one journal entry.

These entries capture:

- Discussions
  - New ideas
  - Dead ends
  - Open questions
  - Future work
- 

## Specification

Purpose:

Stable documentation of accepted discoveries.

Everything here should have originated in Research.

Nothing should appear here without evidence.

---

## Foundations

The philosophical and structural foundations.

Examples:

- Language expresses relationships.
  - Primitive definitions.
  - Discovery principles.
- 

## Ontology

Defines what exists within the framework.

Examples:

- Node
  - Relationship
  - Modifier
  - Pattern
  - Context
  - Intent
- 

## Primitive Nodes

Formal specification of every primitive node.

---

## Primitive Relationships

Formal specification of relationships.

Examples:

- Identity
  - Ownership
  - Cause
  - Location
  - Comparison
- 

## Primitive Modifiers

Examples:

- Quantity

- Degree
  - Negation
  - Possibility
  - Perspective
- 

## Language Patterns

The official pattern catalog.

Each pattern should include:

- LP Identifier
  - Three Names
  - Academic
  - Engineering
  - Plain Language
  - Intent
  - Semantic Structure
  - Grammar Structures
  - Examples
  - Variations
  - Constraints
  - Failure Modes
  - Related Patterns
  - Supporting Discoveries
- 

## Corpus

Purpose:

The evidence base.

Contains categorized examples from:

- Conversation
- Literature
- Programming
- Science
- Law
- Philosophy
- Children's books
- Journalism
- Religion

- Poetry

Every hypothesis should reference examples from the corpus.

---

## Glossary

Formal definitions for every project term.

Examples:

- Node
  - Relationship
  - Primitive
  - Pattern
  - Discovery
  - Observation
  - Confidence
  - Context
- 

## Contribute

Defines how contributors participate.

Should explain:

- Research process
  - Proposal lifecycle
  - Pull Request workflow
  - Evidence requirements
  - Review process
- 

## About

Project history.

Research philosophy.

Maintainers.

Version history.

---

## Global Metadata

Every research artifact should expose consistent metadata.

Example:

ID: H-001

Status: Hypothesis

Confidence: 2 / 5

Created: 2026-07-19

Last Updated: 2026-07-19

Related:

O-001

Q-001

E-001

Every specification page should expose:

Specification: LP-001

Status: Accepted

Confidence: 5 / 5

Supporting Discovery:

D-004

Supporting Experiments:

E-001

E-003

Supporting Hypotheses:

H-001

---

# Traceability

Every object in the project should be fully traceable.

Example:

```
graph TD; A[Observation] --> B[Question]; B --> C[Hypothesis]; C --> D[Experiment]; D --> E[Discovery]; E --> F[Specification];
```

Observation  
↓  
Question  
↓  
Hypothesis  
↓  
Experiment  
↓  
Discovery  
↓  
Specification

Users should be able to navigate this chain in both directions.

---

## Design Principles

The website should emphasize:

- Simplicity
- Transparency
- Traceability
- Versioning
- Scientific rigor
- Long-term maintainability

This is a research platform first and a documentation site second.

---

## Initial Milestone (Discovery 001)

The first implementation should focus on scaffolding only.

Deliverables:

- Website structure
- Navigation

- Page templates
- Metadata model
- Research artifact types
- Specification artifact types
- Cross-linking model

Content depth is secondary.

The goal is to establish the architecture that will support years of iterative research.
